## R851V STEP CONTROLLER WITH INTEGRATED VERNIER STAGE

- Pulsed or analog 0 to 10 Vdc vernier stage
- 8 step models
- Up to 16 stage total with a slave unit
- Test button

## DESCRIPTION

The Viconics R851V series step controller is designed for cost effective, precise modulation of multi-stage control application. A common application is a multi-step electric duct heater.

An integrated vernier control output will give a precise and full modulation of the load from 0 to $100 \%$ of the total capacity.

FEATURES AND BENEFITS

| Microcomputer-based design | Accuracy and reliability |
| :--- | :--- |
| Adjustable inter-stage delay | Provides flexibility in <br> replacement applications |
| Adjustable Vernier ratio | Simplifies design of <br> proportional stage |
| Choice of pulsed or analog <br> Vernier output | Permits use of SCR or lower <br> cost SSR |
| Up to 16 stages | One product family can handle <br> all applications |
| Choice of LIFO or FIFO <br> sequencing | Increased flexibility of FIFO <br> permits even use of contactors |
| Test button | Quick troubleshooting |

## MODELS AVAILABLE

The R851V is available in 1 model

- R851V-8 8 stage unit

If more than 8 stages are required, the R851B-8 can be used as a master unit with another R851V as a slave unit. Adding another unit can bring the total step number up to 16.

## SPECIFICATIONS

Operating conditions:
$0^{\circ} \mathrm{C}$ to $80^{\circ} \mathrm{C}\left(32^{\circ} \mathrm{F}\right.$ to $\left.176^{\circ} \mathrm{F}\right)$
$0 \%$ to $95 \%$ R.H. non-condensing

Relay outputs:
Pilot duty:

$$
\begin{array}{ll}
- & 24-120 \mathrm{Vac}-720 \text { VA } \\
- & 240 \mathrm{Vac}-690 \mathrm{VA}
\end{array}
$$

## Motor load:

$$
\begin{array}{ll}
- & 120 \mathrm{Vac}-1 \mathrm{HP} \\
- & 240 \mathrm{Vac}-2 \mathrm{HP}
\end{array}
$$

Vernier stage: 0 to $10 \mathrm{Vdc}, 5 \mathrm{~mA}$ max.

$$
\text { Vdc pulsed, } 6 \mathrm{Vdc}, 30 \mathrm{~mA} \text { max. }
$$

Input impedance: 0 to 10 Vdc into $10 \mathrm{~K} \Omega$ minimum
Power supply: $24 \mathrm{Vac}-15 \%,+10 \% 50 / 60 \mathrm{~Hz}$; up to 18 VA
Use a Class 1 ( properly fused ) or Class 2, CSA or UL recognized transformer for power supply \& relay outputs.
Agency Approval: cULus File \# E212649
Specifications and equipment are subject to change without prior notice.
OVERRIDE TEST BUTTON
The override test button can be used to by-pass the interstage delay and bring on all stage at one time. This simplifies the verification of configured maximum number of stage. A status led per step will come on for each of the configured stage.

## INPUT SIGNAL

The R851V has four INPUT dip switch (S1 to S4) to select the control signal input:
They are compatible with industry standard signals.
DIP SWITCH ADJUSTMENTS \& WIRING CONTROL INPUT

| Input Signal Switch | Switch \#1 | Switch \#2 | Switch \#3 | Switch \#4 |
| :--- | :---: | :---: | :---: | :---: |
| 0 to 10 Vdc control signal ( 2 to 10 Vdc control range ) | Off | Off | Off | On |
| 4 to 20 mA control signal | Off | Off | On | Off |

If a slave unit is used, wire the control signal input to the master unit only

| 2 To 10 Vdc Or 0 To 10 Vdc Stand Alone Thermostat ( Power To The Thermostat Is Supplied By The R851V ) |  |
| :---: | :---: |
|  |  |
| 2 To 10 Vdc Or 0 To 10 Vdc From D.D.C. Building Automation System | 4 To 20 mA From D.D.C. Building Automation System |
|  |  |

## 24 VAC POWER \& RELAY OUTPUT WIRING

The wiring diagrams are for the R851V-8 models with 8 outputs. The wiring for the R851V-4 is the same except that the unit only has 4 outputs.

## Terminals

Screw terminal \& connector \#1
Screw terminal \& connector \#3

Common Screw terminal \& connector \#2 24 Vac
Control Signal input

- It is not necessary to ground any leg of the transformer to earth with the controller card.
- The controller uses internally a half wave rectifier bridge. On 0 to 10 Vdc control signal, the reference of the control signal is the Common of the power supply of the SCR controller card.
- Use a Class 1 ( properly fused ) or Class 2, CSA or UL recognized transformer.

The intensity of the yellow status LED on the master unit is proportional to the slave output.

Install on the mounting plate on the electrical cabinet using five \#6 pan head metal screw. Do not over torque the screws to prevent damage to the board. Specifications and equipment are subject to change without prior notice.

All R851V series controls are for use only as operating controls. Whenever a control failure could lead to personal injury and/or loss of property, it becomes the responsibility of the user to add safety devices and/or alarm system to protect against such catastrophic failures.

## LIFO / FIFO ADJUSTMENT

The R851V series features 2 different staging sequences:

- LIFO LAST IN FIRST OUT ( CONTROL SWITCH \#1 OFF, FACTORY DEFAULT )

This is the regular mode. Stage \#1 will always be the first to energize and the last stage to de-energize

- FIFO FIRST IN FIRST OUT ( CONTROL SWITCH \#1 ON )

In this mode, the stages are rotated to ensure a more uniform wear of the contactors and elements. For example, on an increase in demand, stage 1 will be energized following by stage 2 , etc. On a decrease in demand, stage 1 will de-energized first followed by stage 2, etc.

Please verify that if this mode is enabled, the manufactured product still complies with active codes and regulations.

## VERNIER STAGE SELECTION AND WIRING

The Viconics R851V series step controller has an integrated vernier control output. This output will give a precise and full modulation of the load from 0 to $100 \%$ of the total capacity of the unit. If a master slave application is used, always connect the vernier output of the master unit.

## ADJUSTMENTS

Functions of the units can be configured with six dip switch and 2 potentiometers.

## Interstage delay potentiometer setting

Two potentiometers are used to adjust the interstage delay from 5 seconds up to10 minutes.
This delay is active in 3 ways.

- Minimum time delay between each step activation when the control signal rises
- Minimum ON time when the step is activated
- Minimum time delay between each step de-activation when the control signal drops

Vernier stage ratio
A potentiometer is used to adjust the vernier stage ratio from $100 \%$ to $200 \%$ capacity of the other on/off stage capacity.

## RATIO SETTING

(See also slave application section at the end )
First adjust the vernier stage ratio potentiometer. This will insure a smooth capacity rise of the total load.

## Example 1:

The total unit has 100 kW divided in 10 equal stage of 10 kW .
If only 10 kW is used as the modulating stage, then the heater would have 9 on/off mechanical stage plus one modulating stage. This modulating stage has the same value as all the other stage. Adjust the vernier stage ratio potentiometer to $100 \%$.

Example 2:
The total unit still has 100 kW divided in 10 equal stage of 10 kW .
If 20 kW are used as the modulating stage, then the heater would have $8 \mathrm{on} / \mathrm{off}$ mechanical stage plus one modulating stage. The modulating stage has twice the value as all the other stage. Adjust the vernier stage ratio potentiometer to $200 \%$.

- TYPE OF VERNIER STAGE SETTING

The vernier stage output can be configured to operate either as a:

- Vdc pulsed output to activate an R810 power module
- 0 to 10 Vdc analog output to activate an R820 SCR power controller.

## - VERNIER STAGE WIRING

| Control Switch \#2 On | Vdc pulsed to activate R810 power modules |  |
| :---: | :---: | :---: |

## SLAVE APPLICATION SECTION

When using a unit for slave applications, it is important that the proper adjustments \& setting be made to the unit for proper operation of the system.
The yellow LED near the vernier output connector is proportional to the vernier output of the master unit ( 0 to 5 Vdc ).

## On the slave unit:

- Set vernier ratio potentiometer to $100 \%$
- Set interstage delay potentiometer to the same value as the master unit
- Set all control signal INPUT dip switch to OFF

## TEST MODE BUTTON

The test mode button can be used to verify if the number of stage have been configured properly.

1. Press and hold the button for 3 to 4 seconds.
2. If a slave unit is used, press \& hold the 2 units button simultaneously
3. All the selected stage will come on, one after the other until all selected number of stages are all on.
4. There is a delay of approximately 5 second between each step activation.
5. When all selected stage are on, they will stay on for approximately 30 seconds before shutting down.

Powering up the R851V controller while holding down the test button will by-pass the interstage delay for 10 minutes. During that period, the unit will respond to a changing signal input very rapidly. Also hold down slave test button on start-up if a slave unit is used. After that 10 minute period, the unit will function normally with the interstage delays active
